

# SIMPLE SAVER SYSTEM®

## The Simple Saver System is the best insulation system for post frame buildings.

Once you've decided that a post frame building will suit your needs, the next question is how to keep that structure as energy efficient as possible. Look no further than the Simple Saver System. The insulation system is installed either on the bottom side of the wood trusses or in between the trusses on the underside of the wood purlins (see photo above). The first method creates an attic space that provides an air cushion of R-values; the latter saves space and delivers the same uncompressed insulation R-values. No matter where you choose to install your system, the Simple Saver System will save you money by shielding your building's interior from unwanted heat gain in the summer and will retain heat in the winter. Additionally, the strong fabric liner system provides high light reflectivity and is 0.02 perm rated for fighting condensation.

The Simple Saver System strives to be the best insulation system available for post frame buildings in agricultural, storage, and workshop applications. The System offers:

- Full, uncompressed installed R-values for roof and walls.
- A clean finished appearance that can eliminate dust build-up on trusses, birds perching on trusses and costly ceiling metal panels.
- High light reflectivity (up to 85%) that reduces the number of light fixtures.
- Better acoustics with high sound absorption (75% noise reduction).
- Lower monthly energy costs (and up to 50% reduction in HVAC equipment).
- Inexpensive solution for following roof angles or creating attic spaces.
- Custom-colors available (including flat black).
- Solutions for hanging objects from the finished ceiling.
- A highly durable solution for multipurpose buildings—such as a combination machinery storage/workshop—that is easy to clean and maintain.
- Free design-build energy analysis sales materials.

When you're looking for a comfortable, productive environment, the Simple Saver System can be relied on to deliver for you as it has for thousands of projects over the last 25 years.

Call Thermal Design today at (800) 255-0776 for more information on why the Simple Saver System is the most effective energy-saving component for your post frame building.
