

**TECHNICAL BULLETIN 022:
FILLING CAVITIES WITH INSULATION**

Thermal Design always recommends filling the cavity with insulation to assure the highest in place R-values and to avoid possible condensation problems. Leaving an air space in any cavity should require ventilation, the same as in any attic space. Filling the cavity also helps eliminate "roof rumble," caused by wind blowing across the roof sheets and allowing the roof to diaphragm.

For further information, contact your Simple Saver System® sales representative at (800) 255-0776.
